

Amazon Lightsail

A Virtual Private Server (VPS) backed by AWS infrastructure. Similar to an EC2 instance, but has fewer configurable steps.

Easy to use at a low cost point and good for hosting simple websites and apps. You can run multiple Lightsail instances, and connect them to other AWS resources and existing VPC

Deploying a Lightsail Instance

Can be done from a single page with a few config options. Lightsail can be accessed from the AWS console under Compute, or from the Lightsail homepage.

Click Create Instance > Select region, platform, blueprint, launch script > Choose monthly price > Click Create Instance

- **Storage:** overview of your current storage
- **Metric:** graphical view of your metrics, utilization, networks, status checks
- **Networking:** view IP address information and simple firewall
- **Snapshots:** a simple way to back up your instance
